## Description of Position

The Legal Analytics Lab is a partnership between the Robinson College of Business' Institute for Insight (the business school's data analytics unit) and the College of Law that uses the tools of data science to study large numbers of legal documents to find patterns, predict outcomes, and unlock insights.

The GRA will assist Lab faculty with a variety of research projects that involve analyzing different types of legal text (e.g., judges' orders, docket sheets, contracts, arbitration awards). For example, in a project that attempts to identify the legal rules that judges rely upon most frequently in a certain area of law, the GRA might be tasked with researching that area of law to identify the set of legal doctrines that a judge might employ. The GRA would next read a set of opinions to identify the specific keywords that are associated with each doctrine. This work would then guide analytics students and faculty in writing code to parse a larger set of judges' opinions in order to identify the presence of doctrine-associated keywords.

## Preferred Skills/Background (e.g., class prerequisites, class standing, statistical skills etc.)

- Weekly meeting with faculty
- Most work completed independently, though sometimes in-person working sessions with a larger team of law and analytics students may be required
- Availability by email to receive project updates and direction

## RESPONSIBILITIES:

- Excellent legal research skills, attention to detail, curiosity and eagerness to learn new approaches to legal
problems are a requirement.
- Previous experience with computer science or engineering, coding, or data analysis is a plus, but not required.
- Ability to complete tasks accurately and on time is a non-negotiable requirement.

Other relevant information (required schedule, form of submissions etc.)

Please email your transcript (can be unofficial), CV, and a brief description of your qualifications to calexander@gsu.edu.
